QUICKPICK[®]
REMOTE

LIFT TECHNOLOGY

Optimise manual labour.

Operators work faster, safely, with QuickPick® Remote technology for Crown stackers. In-hand control of lift functions ensures ideal work heights, saves steps, and minimises stress and strain.

Remote lift gives Crown pedestrian stacker operators an extra helping hand when performing manual work. Consider the benefits operators have reported when using QuickPick Remote.

"When I'm working near the forks, I don't have to walk back to the controls to adjust the fork height, and that saves a lot of steps."
Machine Shop

"I have less back pain with the remote lift glove option, because it's easy to position the forks at the exact height I need."
Retail Stocking

"This glove lets me make height adjustments from any spot around the truck so I can get a better view and keep moving."
Assembly Line Material Handling

"It's a real advantage being able to control lift and lower even when I'm carrying something."
Order Picking

"I used to lift things by hand when they were too low or high because I didn't want to take the time to walk back to the controls. Now I use the glove for height positioning, so it's much easier to save my back."
DIY Retail, Pulling Stock for Customer Orders

The Optimal Height

Remote lift allows operators to position forks at the optimal height (from 400 mm to 1,800 mm) as they load or unload a pallet, minimising the risk of strain or injury. It also simplifies transferring objects between forks and a rack or platform.

1

Control in hand

Save the time and effort of walking to the back of the truck to position the forks.

2

Less stress and strain

Choose the ideal height for manual lifting/transfer and avoid manual high-risk lift zones.

3

Mobile efficiency

Activate lift and lower functions anywhere near the truck, even with hands laden.

A Hands-On Solution

When Crown stacker operators need an extra hand for manual tasks, QuickPick Remote technology is a natural choice. It's another innovative technology from Crown focused on safety and efficiency.
